

eGFR estimated Glomerular Filtration Rate (blood creatinine test)

eGFR test

- The eGFR blood test shows how well your kidneys are working.
- Your eGFR is a number based on the amount of creatinine (a natural waste product) in your blood.
- Creatinine is a waste product that comes from using your muscles. People who are more muscular naturally have higher levels of creatinine.
- Healthy kidneys filter creatinine out of your blood. Having too much creatinine in your blood can be a sign of kidney disease.

Learn your eGFR

- The only way to know your eGFR is to have a blood test to check how much creatinine is in your blood.
- eGFR is calculated using your creatinine level, age, gender and race/ethnicity.

More than **60**

If your eGFR is 60 or above

- This is a normal result for most people.
- Ask your doctor when you should be tested again.
- Follow a healthy lifestyle to prevent kidney disease.

Less than **60**

If your eGFR is less than 60

- An eGFR of less than 60 for 3 months or more could mean you have kidney disease.
- If this was your first eGFR test, ask your doctor when you will need to be tested again.

Less than **15**

If your eGFR is less than 15

- An eGFR of less than 15 could mean you have kidney failure.
- Visit your doctor right away.

eGFR and the stages of chronic kidney disease (CKD)

Stage 1: Kidney damage and eGFR greater than 90

- Stage 1 CKD means you have some signs of kidney damage (like protein in your urine, or physical damage to the kidneys), but your eGFR is greater than 90.
- An eGFR greater than 90 is considered healthy if you do not have other signs of kidney damage.
- Follow a healthy lifestyle, and talk to your doctor about how to prevent your kidney damage from getting worse.

Stage 2: Kidney damage and eGFR 60-89

- Stage 2 CKD means you have some signs of kidney damage (like protein in your urine, or physical damage to the kidneys), but your eGFR is between 60 and 89.
- An eGFR between 60 and 89 is considered healthy if you do not have other signs of kidney damage.
- Follow a healthy lifestyle, and talk to your doctor about how to prevent your kidney damage from getting worse.

Stage 3: eGFR 30-59

- Stage 3 CKD means your kidneys are moderately damaged, and are not working as well as they should.
- Talk to your doctor about seeing a nephrologist (a kidney doctor).

Stage 4: eGFR 15-29

- Stage 4 CKD means your kidneys are severely damaged, and are not working nearly as well as they should.
- Work with your nephrologist to make a treatment plan.

Stage 5: eGFR less than 15

- Stage 5 CKD means your kidneys are getting close to complete failure, or have already failed.
- Once your kidneys have failed, you will need to start dialysis or have a kidney transplant to live.

Slow or help prevent kidney disease!

If you have diabetes, control your blood sugar.

Keep a healthy blood pressure.

Follow a low-fat, low-salt diet.

Do not smoke or use tobacco.

Set a goal to exercise for 30 minutes a day, 5 days per week.

Keep a healthy weight.

Ask your doctor if there are any medicines you should take to protect your kidneys.
